## **CEA Primer on Global Ocean Threats**

"In 2019, CEA was hired to convene a group of leading scientists and philanthropic funders to discuss the current state of knowledge on ocean alkalinity enhancement (OAE), a potentially promising carbon dioxide removal strategy. In preparation of the meeting, CEA produced a comprehensive primer highlighting the technological approaches and open questions and reviewed the known and unknown potential ecosystem implications of OAE. After a productive convening in September 2019, CEA produced a proceedings document, co-authored by attending experts. The proceedings document includes a summary of philanthropic investment opportunities discussed during the meeting."
