European Academies' Science Advisory Council: Emissions Trading System: Stop Perverse Climate Impact of Biomass by Radically Reforming CO2 Accounting Rules

"Several European countries who are considered leaders in climate protection owe their apparently good emission reductions to biomass. These might turn out to look quite different in the future, if carbon-accounting under the Emissions Trading System (ETS) were to be based on science and the real effects on climate. As the European Commission works on a revision of its central climate policy tool, the European Academies' Science Advisory Council suggests a radically new standard."
